

1.1 Core Framework: The Five-Dimensional Diagnostic Lens

Use this framework every time you read AI-generated dialogue that sounds flat. Scan each dimension independently. Name what collapsed. Then correct only the failing channels.

#	Dimension	What It Governs	Diagnostic Question
1	Cadence	Rhythm and pacing of speech	Are the sentences delivered at a uniform tempo, or do they alternate between clipped bursts and longer controlled lines?
2	Vocabulary Range	Ceiling and floor of word choices	Are the words polite and mid-register, or do they match the character's specific texture (blunt, lyrical, technical, colloquial)?
3	Sentence-Length Variance	Fluctuation in sentence length within a single speech	Are all sentences roughly the same length (metronomic), or do they alternate dynamically?
4	Emotional Register	Baseline emotional temperature and expressiveness	Is the tone uniformly warm and courteous, or does it match the character's specific temperature (guarded, effusive, sardonic, tender)?
5	Conversational Rhythm	How the character enters, sustains, and exits exchanges	Does the character wait politely and respond fully, or do they interrupt, deflect, trail off, or barrel through?

Quick-Reference Rule: Voice bleed occurs when one or more dimensions collapses toward the AI's default register: medium-length sentences, polite mid-range vocabulary, uniform emotional warmth, steady predictable rhythm, and orderly turn-taking. If your character sounds like a well-meaning colleague in a professional meeting, all five dials have been snapped to neutral.
