

7.2 The Library Architecture Blueprint

7.2.1 The Five Organizational Tags

The library uses five tags to build a path for finding information. That path is made up of five questions and their five answers, all kept together in one file.

Tag	What It Identifies	Example
Series	Which book or series the asset belongs to	"The Ashford Series" or "Standalone: Winter Hearts"
Character	Which character the asset belongs to	"Callum" or "Mara"
Arc Stage	Where the character is in their emotional journey	"Book 1 — Maximally Guarded" or "Book 4 — Defenses Cracking"
Emotional State	The specific emotional configuration the asset governs	"Baseline Guarded" / "Vulnerability" / "Conflict"
Scene Type	Which of the eight scene types the asset is calibrated for	"Dark Moment" / "First Kiss" / "Banter-Heavy Montage"

7.2.2 Folder Structure Template

Create this structure in your document-management tool (Scrivener research folder, Notion database, or file system).

```
Character Voice Library/  
└─ [SERIES_NAME]/  
    └─ [CHARACTER_NAME]/  
        └─ [ARC_STAGE_1]/  
            │ └─ [CHARACTER_NAME] - Dialogue Matrix - [ARC_STAGE] -  
[EMOTIONAL_STATE] - [SCENE_TYPE] - v1.0 - [DATE]  
            │ └─ [CHARACTER_NAME] - Three-Tier Emotional Filter - [ARC_STAGE] -  
[EMOTIONAL_STATE] - [SCENE_TYPE] - v1.0 - [DATE]  
            │ └─ [CHARACTER_NAME] - Genre Calibration Settings - [ARC_STAGE] -  
[EMOTIONAL_STATE] - [SCENE_TYPE] - v1.0 - [DATE]  
            └─ [ARC_STAGE_2]/  
                │ └─ [Same three asset types, updated versions]  
                │ └─ ...  
            └─ Archive/  
                └─ [All previous versions, retaining original names]
```

Structure rules:

- The path from the top-level folder to any file must take no more than four clicks.
- Each character gets their own folder that contains every version of every asset.
- The active folder holds only the most current version of each asset.
- The Archive subfolder keeps all previous versions, and you organize and retain every version.

7.2.3 Naming Convention Reference

Every file in the library follows this format:

"[CHARACTER_NAME] — [ASSET_TYPE] — [ARC_STAGE] — [EMOTIONAL_STATE] — [SCENE_TYPE] — v[VERSION_NUMBER] — [DATE]"

Example: *"Callum — Dialogue Matrix — Book 3 — Baseline Guarded — All Scenes — v2.1 — 2025-01-15"*

This convention makes every asset identifiable, sortable, and retrievable without opening the document. You can scan the folder and know exactly what each file contains before you click.
