

8.2 The Model-Update Response Protocol

Execute this three-step protocol whenever you notice output behavior changing after an AI platform update. Total time: approximately fifteen minutes.

8.2.1 The Three-Step Response Sequence

Step 1: Rerun the Voice Bleed Diagnostic

- ☐ Open your AI tool.
- ☐ Generate a test scene using your existing Dialogue Matrix for one character.
- ☐ Run the five-dimensional diagnostic from Chapter 1.
- ☐ Identify which dimensions have shifted.
- ☐ Log the specific changes in your Model-Update Log (see 8.2.2).

Step 2: Adjust the Affected Modifiers

- ☐ Open your Dialogue Matrix.
- ☐ For each drifted dimension, adjust the corresponding constraint statement:
 - Cadence flattened → Tighten the Rhythm Lock
 - Vocabulary widened → Lower the Ceiling Cap
 - Emotional register warmed → Adjust the Baseline Temperature
- ☐ Work one adjustment at a time.
- ☐ Regenerate the test scene after each single modification.
- ☐ Verify the correction before moving to the next adjustment.

Step 3: Update the Library Version Tag

- ☐ Confirm the voice holds across your three-scene stress test.
- ☐ Increment the minor version number on the affected Dialogue Matrix file.
- ☐ Note the date and the platform update that triggered the adjustment.
- ☐ Save the file. The archive holds the previous version; the active folder holds the corrected one.

8.2.2 Model-Update Log Template

Keep this log in your Library's top-level folder. One entry per platform update.

Date	Platform Update	Dimensions Affected	Adjustments Made	Version Updated To	Verified?
[DATE]	[E.G., "GPT-4o spring update"]	[E.G., "Cadence, Emotional Register"]	[E.G., "Tightened Rhythm Lock; lowered Baseline Temperature by one increment"]	[E.G., v2.3]	[Yes / No]
[DATE]	[UPDATE]	[DIMENSIONS]	[ADJUSTMENTS]	[VERSION]	[Yes / No]

8.2.3 Contingency: When You Cannot Run the Full Protocol Immediately

If a deadline prevents you from completing all three steps at once:

- ☐ Perform Step 1 only: generate a test scene and run the diagnostic.
- ☐ Log the findings in your Model-Update Log.
- ☐ Complete Steps 2 and 3 within forty-eight hours.

This ensures the shift is identified quickly and the correction follows in a controlled, documented sequence.
